

REPORT FOR WEBSITE PROJECT: SOCIAL MEDIA SAVVY

NAME: Omotola Matilda Shogunle

STUDENT ID: @00442280

PROJECT: WEBSITE DESIGN USING HTML AND CSS

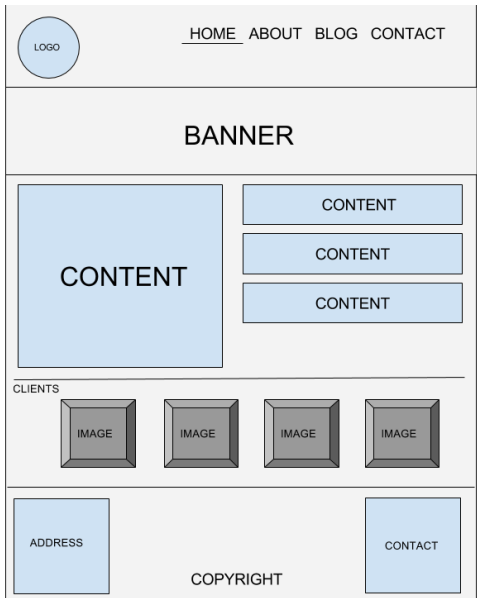

URL: <http://lae891.edu.csesalford.com/>

SITE CONTENT AND DESIGN

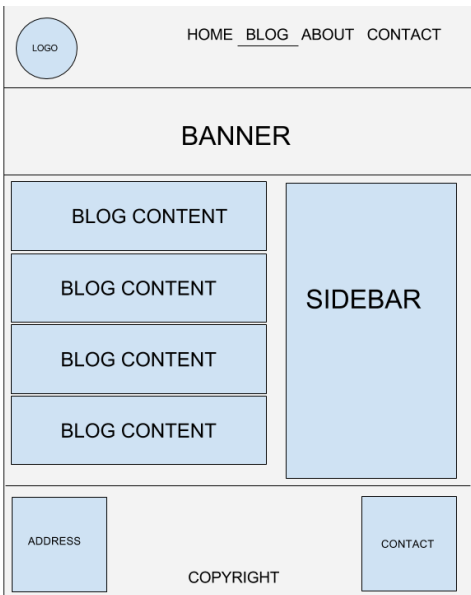

The name of my website is called Social Media Savvy. It is a website that mimics an organization that endeavours to build the social media presence of individuals or companies and their brand. I decided to work on a website that is based on a company because I wanted a more professional approach to building my website. The languages used to build this website was strictly HTML5 and CSS3. My design is geared towards a liquid layout approach using flexboxes. This website is 100% semantic but it faces difficulties with compatibility with older browsers which may not support some of the css syntax being used. Below is the wireframe layout of the website.

WIREFRAMES

MOBILE VERSION

USE OF HTML5

<title> SMS | Social Media Savvy </title>

This element was used to define the name that should appear on the tabs when the website page is being loaded.

<header>

I used the header tag to contain my site navigation bar and site logo. A header tag was more efficient to use because it serves as the container for the introductory content of the website.

<section>

The section tag was used to identify different sections of my page like the section for my articles and another for the clients that the employees at Social Media Savvy have worked with. I used the section instead of the div to divided my page mainly because it is a more up-to-date format of writing pages that are semantic.

<footer>

The footer tag was used to house information like address and the contact details of the company. Also this section contains information of the copyright of the website. I also included the social media links to the social pages of the company in the footer for more convenience.

<div>

This element was used to group block elements in the website page. I used the div tag to also create my banner image so it can be manipulated to suite the layout of the website.

```
<div class="banner" id="top">
  
  <div class="slant"><p>I AM</p></div>
  <div class="slant1">
    <h1>SOCIAL MEDIA SAVVY</h1>
  </div>
  <div class="slant2">#joinTheClubBeSocialMediaSavvy</div>
</div>
```

The boxes that contain “I AM” and “SOCIAL MEDIA SAVVY” were manipulated using the div boxes. The smiley is an image on its own.

<p>

This element was used to define paragraphs on my website as it automatically adds a margin after each paragraph is opened and closed.

I used the span element to hook part of some text in my paragraph to enable me uniquely style that part of the text. It was also used to group some inline elements.

```
<span class="price">
  &pound;10/mo<br>
  &pound;120/yr
</span>
```

£10/mo
£120/yr

<label>

I used the label tag to define the label for my input elements. This helps improve accessibility for mouse users, if the users click on the text within the label it toggles the control.

<figure>

This was used in my html file to mark-up images on my website.

<blockquote>

This was used to cite information that was derived from another website. Permission to use content will be found below.

<meta>

This is found in the head of my html pages. It basically gives more information or summary of what the website is about. It was also used to improve Search engine optimization.

```
<meta http-equiv="Content-Type" content="text/html; charset=utf-8">
<meta name= "viewport" content="width=device-width, initial-scale =1, maximum-scale=1"/>
<meta name="description" content="A company that deals with growing an online presence for individuals, bloggers or companys and their brands
We are social media experts and know the the tips and tricks to growing an online empire." />
<meta name="keywords" content="social media, savvy, online presence, experts in social media" />
<meta name="author" content="Omotola Shogunle" />
<meta name="robots" content="nofollow" />
```

<iframe>

The iframe tag was used to identify an inline frame. On the website the html element was used to embed a map for the address of the company.

CSS EXPLANATION

The design for my website is based on a liquid layout with the use of flexboxes, values given for boxes where in percentages. The reason I choose this approach for my design layout is remove the problem of unexplained gaps around website layout, my website was built to fit different devices that the website is viewed on. The layout also allows users to expand fonts larger than what was designed and it still accommodates because the layout stretches. Following laws on website accessibility my website pages have been tested on the accessibility sites and low contrast have been altered to accommodate people with viewing impairment. The colour scheme is a mixture of black, light shade of pink, grey and yellow. Some of the challenges faced with this approach include not having full control over how website would eventually look and there is risk of the design loading differently from how it was coded with unexpected gaps around some elements or items squashed together. Below is a list of CSS I used on the webpage.

CSS PROPERTIES

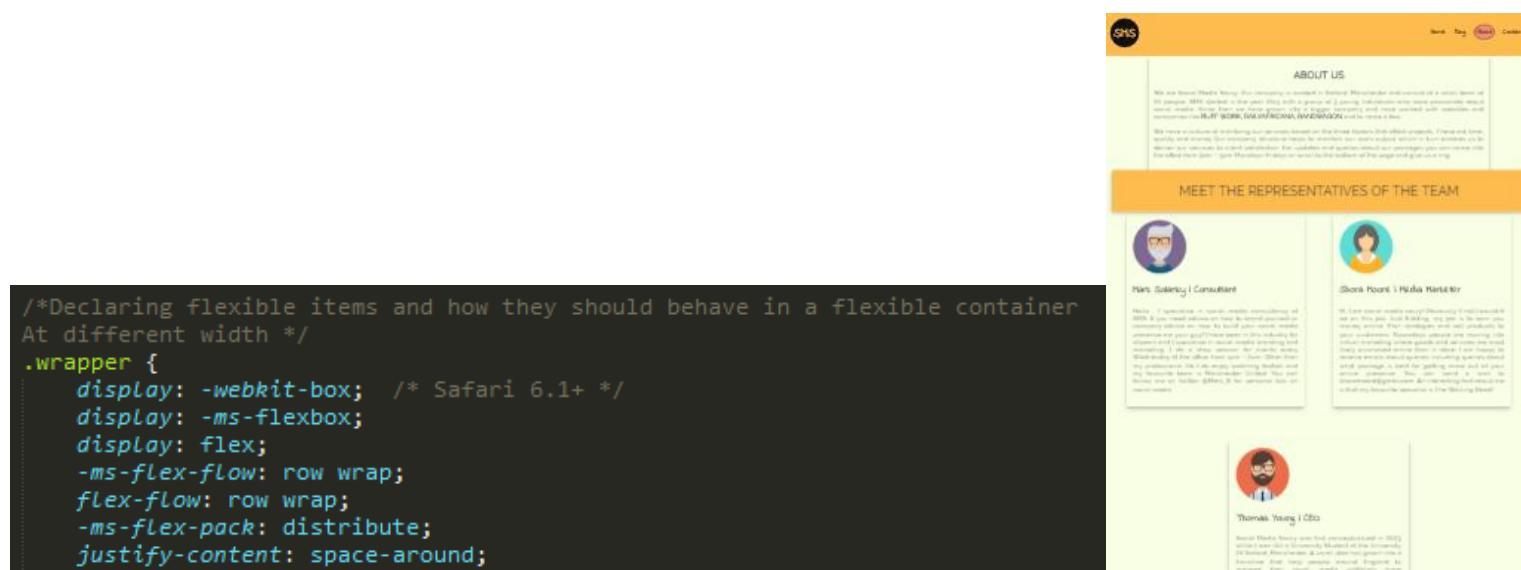

FLEX PROPERTY

This css property specifies the length of a flexible container relative to the rest of the other flexible items inside the same container. Flex grow refers to how much a container would grow relative to the rest of the flexible containers, flex-shrink specifies how much smaller the flexible item will grow relative to surrounding flexible items while flex-basis is the length given to the item. In this case the value was measured in percentages %.

DISPLAY FLEX, FLEX -FLOW AND JUSTIFY CONTENT

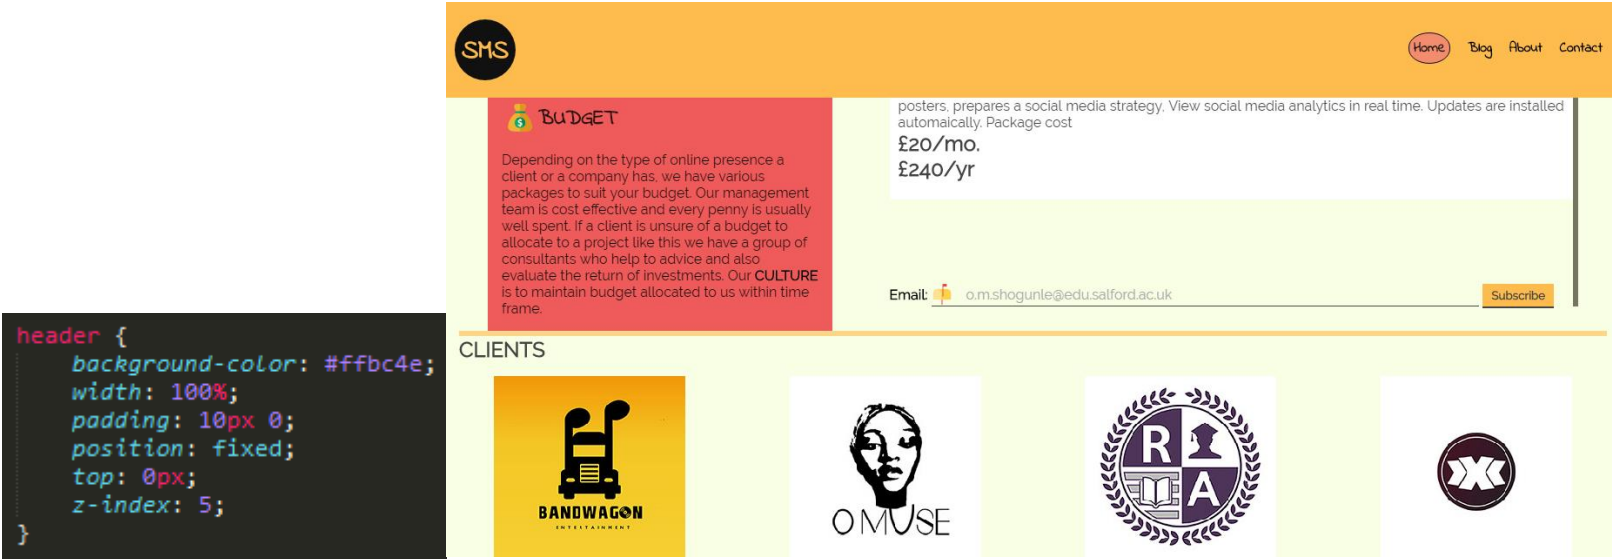

Display flex declares the containers to become flexible items, row wrap simply allows for flexible items to fall into the next line if when loaded on a page the container is too small to fit all items on the same row. Space-around creates some space around each flexible item.

As displayed employee box wraps whenever boxes container reduce.

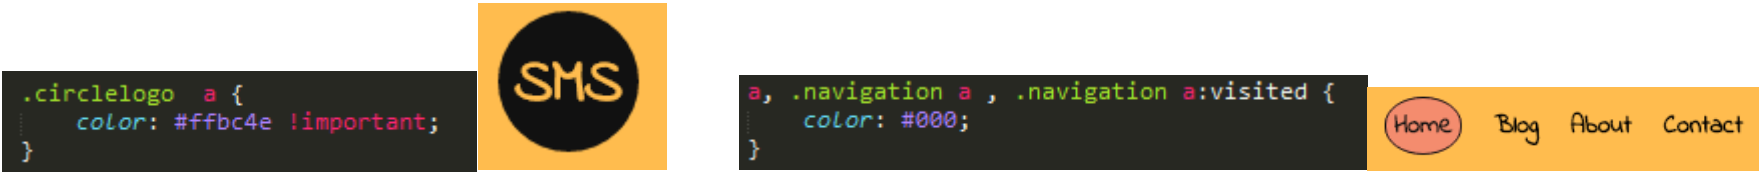

Z-INDEX AND FIXED POSITION

The z-index specifies the stack order of elements in a page, and on my webpage the header has a fixed position at the top of the page and a z-index that puts the header in front of other elements

! IMPORTANT, PSEUDO CLASSES, PSEUDO ELEMENTS

The! important declaration is used to override declarations, in my website I used this property to override the hover effects for the links on the website.

Applied to only the link in the circle logo.

For other links on the page their default display is black colour.

Pseudo classes or elements are used to style specific packs of an element below are some of the application of this classes used on my page, the difference between using a pseudo class and element is that the classes only have a single “.” after them while the elements have “::” colons.

The nth-child(n) property was used to design specific parts of a parent container using the position on the child elements. The odd rows on the table are a light grey colour while the even rows are a white colour.

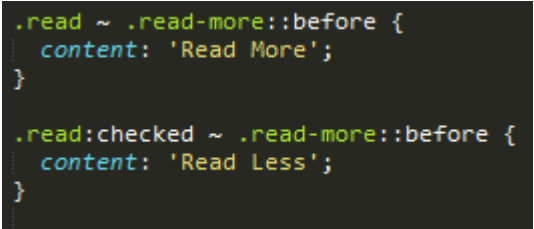

```
table tr:nth-child(even) {
  background-color: #eee;
}
table tr:nth-child(odd) {
  background-color: #fff;
}
```

ITENARY	STARTER	PREMIUM	EXECUTIVE
MONTHLY	£10	£15	£20
YEARLY	£120	£180	£240
DETAIL	COVERS THREE MEDIA PLATFORMS	SET UP FEE INCLUDED	BEST SUITED FOR LARGER ORGANISATIONS

This selects the input elements that have focus.

I used the pseudo element to change the content of my button when clicked for the blog post.

TRANSFORM

The transform property is used to change the orientation of elements on my webpage.

```
.slant {
  max-width: 100%;
  padding: 2px;
  background-color: #f48c6e;
  -webkit-transform: rotate(5deg);
  transform: rotate(5deg);
  width: 30%;
  left: 25em;
  top: 27em;
  position: absolute;
}
```

CSS TECHNIQUES

Techniques used on my website is a collection of inspiration from other web sources and some were also achieved on my own due to my experience with building static pages and playing with the inspect element on the web browsers.

SELECTED NAVIGATION LINK

```
.navigation a.selected, .navigation > a:hover {
  color: #111;
  background-color: #f48c6e;
  padding: 5px;
  border-radius: 50%;
  border: 1px solid
}
```

The selected link in the navigation bar has a round circle and a pink background. This was also tweaked a little bit to improve accessibility for visually impaired users. The idea was gotten from a team treehouse tutor called Nick Pettit on styling navigation bars <https://teamtreehouse.com/nickpettit>.

TEXT FIELDS WITH ONLY BOTTOM BORDER

```
input[type="text"]{
  padding: 3px 40px;
  border: none;
  background-color: #f8ffe5;
  background-image: url(images/envelope.png);
  background-repeat: no-repeat;
  border-bottom: 1px solid #444444;
  width: 70%;
  margin: 7.15em 0 0;
  font-size: inherit;
  font-family: inherit;
}
```

Email:  o.m.shogunle@edu.salford.ac.uk

Subscribe

Normal text fields have the borders at all corners of the field area but in this case the side and top border was removed to make the design more unique. This idea was inspired from an example on the w3school website http://www.w3schools.com/css/tryit.asp?filename=trycss_form_border2

THROBBING TEXT USING ANIMATION KEYFRAMES (SCALE)

```
.slant2{
  position: absolute;
  animation: grow 3s ease 0s infinite normal;
  -webkit-animation: grow 3s ease 0s infinite normal;
  max-width: 100%;
  right: 16em;
  top: 35em;
}

@-webkit-keyframes grow {
  0% {-webkit-transform: scale(1);transform: scale(1);}
  50% {-webkit-transform: scale(1.1);transform: scale(1.1);}
  100% {-webkit-transform: scale(1);transform: scale(1);}
}

@keyframes grow {
  0% {-webkit-transform: scale(1);transform: scale(1);}
  50% {-webkit-transform: scale(1.1);transform: scale(1.1);}
  100% {-webkit-transform: scale(1);transform: scale(1);}
}
```

#joinTheClubBeSocialMediaSavvy

This element throbs indicating to users of the page to join the movement of becoming social media savvy. This element moves using animation keyframes the functionality cannot be displayed here until website page is loaded. Idea was inspired by <http://codepen.io/carltonstith/> heartbeat animation.

ROTATING BACK-TO-THE-TOP BUTTON USING ANIMATION KEYFRAMES

This button consists of two techniques; the button helps navigate users to the top of the page and also rotates around its axis.

```
<div class="top">
  <a href="#top"></a>
</div>
<div class="copyright">
  <a href="#top"></a>
  <p>&copy; Omotola Shogunle 2016. All rights reserved</p>
</div>
```

```
.top img{
  opacity: 1;
  right: 0.5em;
}
```

The class labelled top only shows when the screen is at maximum width of 667px and below. Above that the image is displayed at the footer above the copyright and it rotates at its axis.

```
.copyright img {
  margin: 0 33em;
  max-width: 100%;
  -webkit-animation: spin 3s linear infinite alternate;
  animation: spin 3s linear infinite alternate;
}

@-webkit-keyframes spin{
  0% {
    -webkit-transform: rotate(0);
    transform: rotate(0);
  }
  100% {
    -webkit-transform: rotate(360deg);
    transform: rotate(360deg);
  }
}

@keyframes spin {
  0% {
    -webkit-transform: rotate(0);
    transform: rotate(0);
  }
  100% {
    -webkit-transform: rotate(360deg);
    transform: rotate(360deg);
  }
}
```

The idea for this technique was derived from the W3schools website

http://www.w3schools.com/cssref/css3_pr_transform.asp

TOGGLING THE READMORE BUTTON TO SHOW MORE TEXT

This is one of the most significant techniques used on my website to add more functionality to my blog page. This technique was inspired by the example displayed by Kasper Mickiewicz <https://codepen.io/Idered/pen/AeBgF> . This technique uses the check button to help toggle and display hidden text to screen. All of the code isn’t displayed here only key parts that makes the button work.

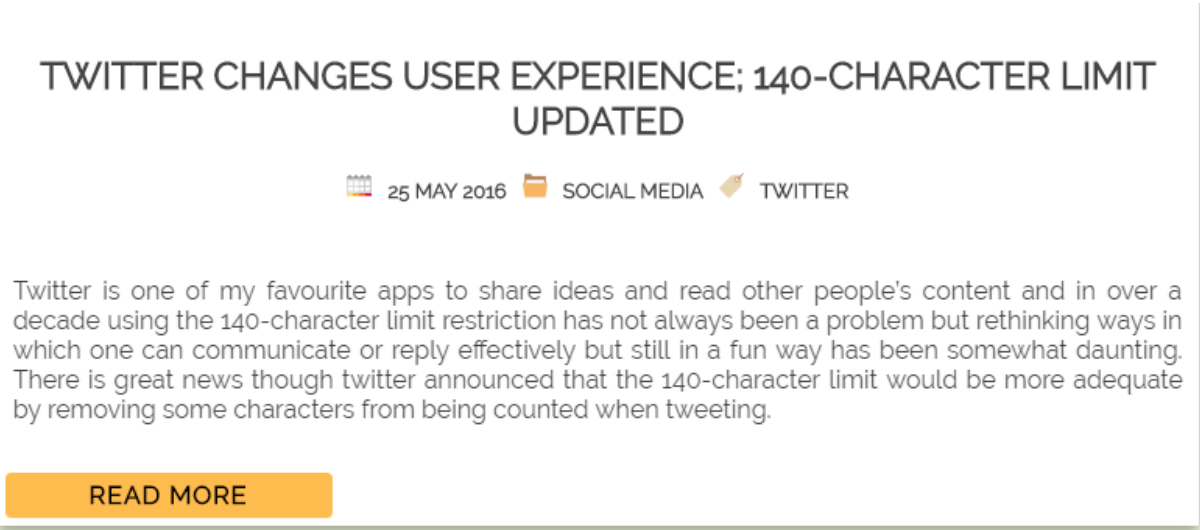

```
.extra
{
  display: none;
  font-size: 0;
}

/*This changes the readmore button when clicked
from read-more to read-less and vice versa*/

.read ~ .read-more::before {
  content: 'Read More';
}

.read:checked ~ .read-more::before {
  content: 'Read Less';
}

.read:checked ~ .extra {
  display: block;
  font-size: inherit;
}
```

Type in your comments below.

HERE IS WHAT HAS CHANGED

Replying Mentions

When replying to a tweet or mention the @names will no longer be included in the word count. This will make ongoing conversations more straight forward and easier, no more unnecessary shorthand for words to make sure conversations are relayed to the group effectively.

Media attachments

Adding photos, gifts, polls or even quotes will no longer count to the 140-character limit set. Leaving more room to type in tweets

 Comment

SUBMIT

READ LESS

The extra text is shown as above and the buttons content changes to read less. Visit the blog part of website for better viewing.

TEXT POP-UP AND IMAGE ZOOMED IN WHEN HOVER OVER IMAGE LINK

This technique is used to show topic headers of blog post users would like to read on other related websites. The technique was inspired from a blog post from <http://geekgirllife.com/animate-text-over-images-on-hover-without-javascript/> by Natalie McLees

```

.related img {
  display: block;
  height: auto;
  -webkit-transition: all 300ms;
  transition: all 300ms;
  max-width: 100%;
}

.related figcaption {
  background: rgba(0, 0, 0, 0.8);
  color: white;
  display: table;
  height: 100%;
  left: 0;
  opacity: 0;
  position: absolute;
  right: 0;
  top: 0;
  -webkit-transition: all 300ms;
  transition: all 300ms;
  -webkit-transition-delay: 100ms;
  transition-delay: 100ms;
  z-index: 100;
}

```

```

.related li:hover figcaption {
  opacity: 1;
}

.related li:hover img {
  -webkit-transform: scale(1.4);
  transform: scale(1.4);
}

.related figcaption p {
  display: table-cell;
  font-size: 1.5em;
  position: relative;
  top: -40px;
  width: 289px;
  -webkit-transition: all 300ms ease-out;
  transition: all 300ms ease-out;
  vertical-align: middle;
}

```

PACKAGE SUBSCRIBE BOXES USING FLEX PROPERTY

CSS3 introduced the use of flex properties which can be used to manipulate flexible items. This technique uses the flex property to define how much space a box would have relative to other boxes. Technique was inspired by this website <https://bitsofco.de/6-reasons-to-start-using-flexbox/>

```

/*This indicates that any box thats not the
second box in the parent "container should
have flex-grow of 1 otherwise 2*/

.flex-box:not(:nth-child(2)) {
  -webkit-box-flex: 1;
  -ms-flex-positive: 1;
  flex-grow: 1;
  height: 200px;
  background-color:#757761;
}

.flex-box:nth-child(2) {
  -webkit-box-flex: 2;
  -ms-flex-positive: 2;
  flex-grow: 2;
  height: 250px;
  background-color:#f48c6e;
}

```

PACKAGE SUBSCRIBE BUTTON CHANGES WHEN HOVERED

When user hovers over the subscribe to plan button an arrow appears and the button expands. This technique uses a pseudo element and css transitions to achieve outcome. Idea derived from http://www.w3schools.com/css/tryit.asp?filename=trycss_buttons_animate1

```

/*Adding functionality to the package button
Button expands and shows arrow when hovered*/

.plan span{
  cursor: pointer;
  display: inline-block;
  position: relative;
  transition: 0.5s;
}

.plan span:after {
  content: '»';
  position: absolute;
  opacity: 0;
  top: -2px;
  right: -20px;
  transition: 0.5s;
}

.plan:hover span {
  padding-right: 15px;
}

.plan:hover span:after {
  opacity: 1;
  right: 0;
}

```

SUBMIT BUTTON SHAKES WHEN HOVERED IN CONTACT FORM

This uses animate keyframes and hover and was derived from <https://css-tricks.com/snippets/css/shake-css-keyframe-animation/>

TESTING (BROWSER, FONT AND SCREEN SIZE, PLATFORM INCLUDING MOBILE)

The graph above shows the Top 9 Browsers that are used to surf the internet, and based on the statistics Chrome is the most used. Therefore, my screenshots for browser testing is going to follow the graph and show browser shots of the most popular in different versions to the list popular. Browsers displayed below include Chrome, Firefox, Safari, Opera and Internet Explorer.

NOTE: IN MY CSS I ADDED BROWSER SUPPORT CODE TO SUPPORT BROWSERS RENDING CSS IN THE RIGHT WAY BUT AS SOME OF THE TECHNIQUES USED IN CSS ARE NEW AND IMPLEMENTED ONLY ON SOME OF THE NEWER BROWSER THE OLDER VERSIONS ARE STILL NOT ABLE TO RENDER WEBPAGES CORRECTLY.

CHROME 18.0. (Does not support the flex-property)

CHROME 27.0 (Does not support the flex-property)

CHROME 30.0 (HOW HOMEPAGE SHOULD APPEAR)

CHROME 39.0 (THE YELLOW BAR IS NOT A CSS PROBLEM
BROWSERSHOT CAPTURED THE PAGE WHILE SCROLLING DOWN)

CHROME 53 (SAME BROWSER SHOT ISSUE)

FIREFOX 7.0 WIN 7 (NOT THE FULL PAGE SCREENSHOT, SUPPORTS SOME FLEX
PROPERTIES LIKE THE ORDER FOR THE NAVIGATION SECTION NAND
ROW WRAP FOR THE ARTICLES BUT DOES NOT SUPPORT FLEX WHICH
TELLS THE BOXES HOW BIG YOU WANT THEM TO BE.

FIREFOX 15.0 (RENDERS SAME WAY AS ABOVE)

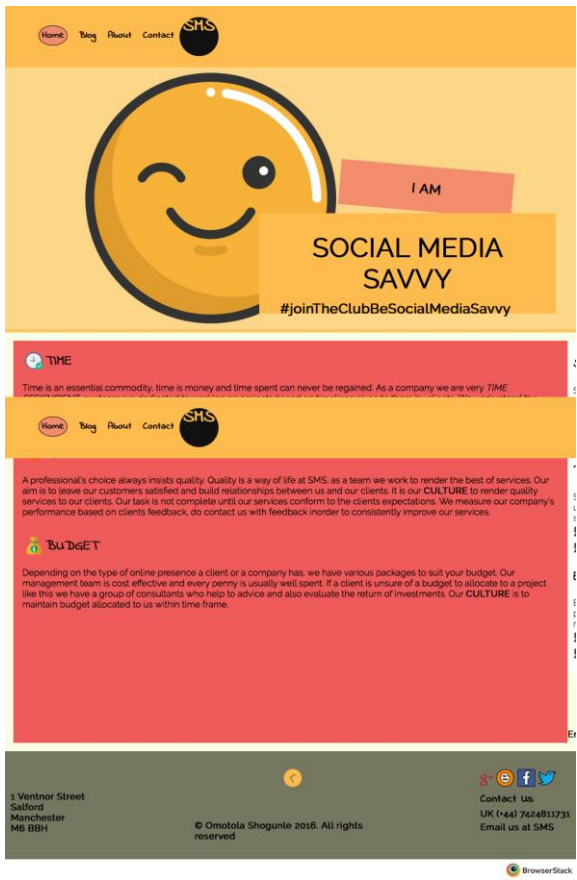

FIREFOX 26.0

FIREFOX 35.0

FIREFOX 45.0

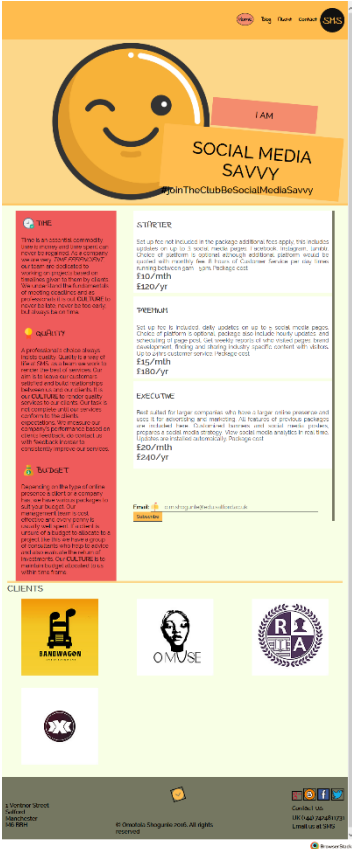

SAFARI 9.1 (PAGE ABOVE IS NOT SCREENSHOT PROPERLY)

SAFARI 6.20

OPERA 12.10

INTERNET EXPLORER 10.0

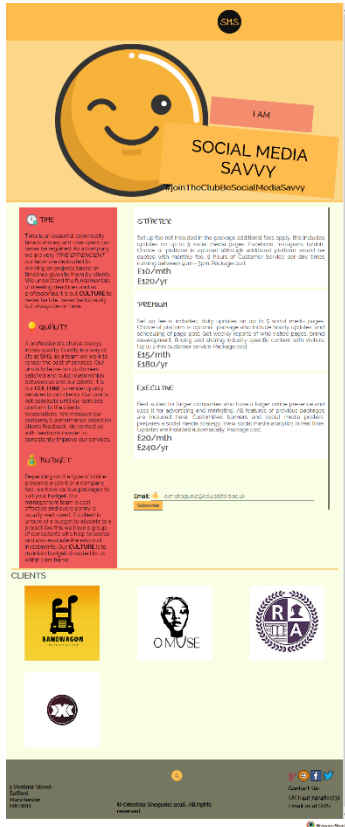

SAFARI 8.0 (OLDER VERSIONS DO NOT SUPPORT FLEX PROPERTIES)

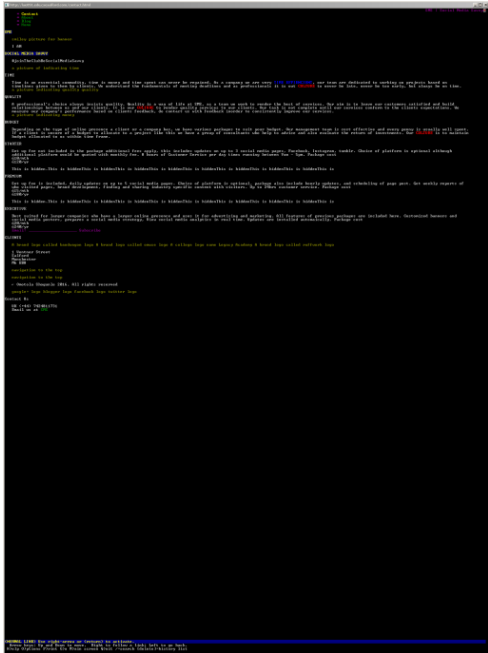

OPERA 12.16 (NOT FULL OAGE CAPTURED)

INTERNET EXPLORER 8.0 (DOES NOT SUPPORT CSS)

INTERNET EXPLORER 11.0

LYNX 2.8 (DOES NOT SUPPORT CSS)

(DOES NOT SUPPORT CERTAIN FLEX DECLATIONS
LIKE ORDER WHICH AFFECTS THE NAVIGATION

The above graph shows that the most used mobile device for internet surfing is the Samsung followed by the Apple phone. Therefore, screen shots would follow the statistics and display homepage on mobile in both portrait and landscape.

COMMENT

Testing and debugging websites so that my webpages could sit well on various devices was done using the website <http://browsershots.org/> and <https://www.browserstack.com>. Though these tools were helpful in making cross browser testing on Chrome, Safari, Firefox, Opera and Lynx some of the screenshots were not captured well thereby displaying a shot of page that looks like the code does not work properly, however they do. The browsers ran on different operating systems like the Windows, Apple OS and also Linux and was also tested on different versions of browsers, due to the introduction of flexboxes which was used on my website some of the shots show that these versions were not compatible. Statistics show that most internet users surf the net using up-to-date versions of their browsers therefore my website displaying properly on these browsers should satisfy user experience. The requirements in this course was to use HTML5 AND CSS3 to fix the compatibility problems maybe the use of other languages like JavaScript would help solve the problem.

The W3C CSS Validation Service

W3C CSS Validator results for [mycss.css](#) (CSS level 3)

Jump to:

Errors (3)

Warnings (139)

Validated CSS

W3C CSS Validator results for mycss.css (CSS level 3)

Sorry! We found the following errors (3)		
URI : mycss.css		
128		Sorry, the at-rule @-webkit-keyframes is not implemented.
229		Sorry, the at-rule @-webkit-keyframes is not implemented.
1102		Sorry, the at-rule @-webkit-keyframes is not implemented.

This CSS Validator assumes that effectively all serious users will be using more up to date versions of each browser therefore causing this error. As this is just an assumption I have decided to leave the rules in place just in case some minority users load the webpage. Nevertheless, the CSS file would validate if the @rule is removed from the file.

BLOG PAGE HAS 4 ERRORS FOR ACCESSIBILITY BECAUSE THE CHECK BOX USED TO TOGGLE THE READ MORE BUTTON DOES NOT HAVE CONTENT WRITTEN WITHIN THE LABEL TAG. INORDER TO FIX THIS I WOULD BE HINDERING THE FUNCTIONALITY OF THAT BUTTON. THEREFORE, I DECIDED

TO NOT TO. THERE ARE OTHER WAYS OF TOGGING THE BUTTON WITHOUT THE USE OF THE CHECK BOX BUT IT IS BEYOND THE REQUIREMENTS OF THIS ASSIGNMENT.

CONCLUSION

I have successfully implemented the use of HTML5 and CSS3 to build a semantic website. Although the languages have some limitations when trying to achieve a fully dynamic website, it is still a very good foundation when introducing other languages that add more functionality. Difficulty faced was in cross browser testing and trying to make website fit well to as many devices as I came across or at least the frequently used devices. Using a liquid layout has a high risk of pages loading incorrectly in various platforms but can be managed using media queries. Social Media Savvy website can be improved by the use of more advanced languages.
